Art Unit: 1635

#### **DETAILED ACTION**

Claims 1-12 and 14 are pending in the instant application. It is noted that the sequences have been rejoined as a result of the petition decision on 1/26/2007.

Applicant's request for reconsideration of the finality of the rejection of the last Office action is persuasive and, therefore, the finality of that action is withdrawn.

# Response to Arguments--Claim Rejections - 35 USC § 112

Claims 1 stands rejected under 35 U.S.C. 112, first paragraph, for the reasons of record set forth in the office actions mailed on 4/14/2006 and 9/18/06, as well as the advisory action mailed on 12/20/06 and reiterated below.

One of ordinary skill in the art would not recognize that applicant was in possession of such a large scope of therapeutic agents, as instantly recited. With regards to claim 1, applicant argues that applicants have no control over inhibitors that have not yet been described in the art. However, the test for written description is possession and applicant clearly is not in possession of any therapeutic agent that is effective to reduce the amount of clusterin in melanoma cells by disclosing antisense oligonucleotides and RNAi inhibitors. The claim embraces a multitude of inhibitors such as small molecule inhibitors, antibodies, miRNAs, ribozymes, aptamers, as well as any other inhibitory agent. Applicant argues In re Fuetterer, which was responded to by the examiner in the office action mailed on 9/18/06. The examiner is not requiring for applicant to discover which possible therapeutic agents will function properly in the method, but rather is requiring a description of an adequate number of species of

Art Unit: 1635

therapeutic agents to be used by the method that is commensurate with the scope of the instant claim so that one of ordinary skill in the art would recognize that applicant was in possession of the claimed invention.

## New Objections/Rejections

## Claim Objections

Claims 6-10 and 12 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

## Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1 and 14 are rejected under 35 U.S.C. 102(b) as being anticipated by Krieg et al. (WO 99/51259).

The above claims are directed to a method for treatment of melanoma in a mammalian subject comprising administering to the subject a therapeutic agent effective to reduce the amount of clusterin in the melanoma cells, wherein the therapeutic agent is an oligonucleotide.

necessarily be reduced as well.

Art Unit: 1635

Krieg et al. teach methods of treating cancer including melanoma by stimulating an antigen specific response against a cancer antigen. Krieg et al. teach methods of treating cancer, more specifically melanoma, comprising introducing a CpG oligonucleotide to a subject in need thereof. Although Krieg et al. are silent as to the ability of the CpG oligonucleotide to reduce the effective amount of clusterin in the melanoma cells, Krieg et al. teach a method of treating melanoma with an oligonucleotide and the method is therefore considered to necessarily reduce the effective amount of clusterin in the melanoma cells, as instantly recited. The instant claims do not recite that the agent or oligonucleotide needs to have any specific relationship with clusterin, but rather be able to reduce the effective amount of clusterin. Since Krieg et al. teach the active step of administering an agent, more specifically an oligonucleotide, to treat melanoma in a subject in need thereof, the oligonucleotide

would necessarily be considered to reduce the effective amount of clusterin as a result

of treating melanoma, absent evidence to the contrary. Since melanoma is being

reduced by the oligonucleotide of Krieg et al., clusterin present in the cells would

As stated in the MPEP (see MPEP 2112), something that is old does not become patentable upon the discovery of a new property. A recitation of the intended use of the claimed invention must result in a structural difference between the claimed invention and the prior art in order to patentably distinguish the claimed invention from the prior art. If the prior art structure is capable of performing the intended use, then it meets the claim. In a claim drawn to a process of making, the intended use must result in a

Art Unit: 1635

manipulative difference as compared to the prior art. See *In re Casey*, 370 F.2d 576, 152 USPQ 235 (CCPA 1967) and *In re Otto*, 312 F.2d 937, 939, 136 USPQ 458, 459 (CCPA 1963). Therefore, the instant claims are anticipated by Krieg et al.

Claims 1, 2, 11, and 14 are rejected under 35 U.S.C. 102(b) as being anticipated by Saijo et al. (Oncology Research, Vol. 6, No. 6, 1994, pages 243-249).

The above claims are directed to a method for treatment of melanoma in a mammalian subject comprising administering to the subject a therapeutic agent effective to reduce the amount of clusterin in the melanoma cells, wherein the therapeutic agent is an oligonucleotide, more specifically an antisense oligodeoxynucleotide. The therapeutic agent is an RNA molecule effective to reduce the amount of clusterin in the melanoma cells by an RNAi mechanism.

Saijo et al. teach a method of administering antisense phosphorothioate oligodeoxynucleotides *in vivo* to mice targeted to LOX melanoma cells and resultant inhibition of tumor growth *in vivo*.

The instant specification discloses "The terms RNA, RNA molecule(s), RNA segment(s) and RNA fragment(s) may be used interchangeably to refer to RNA that mediates RNA interference. These terms include double-stranded RNA, single-stranded RNA..." (see last paragraph on page 5). Therefore, the antisense oligonucleotide of Saijo et al. meets the instant limitation of an RNA molecule that would act via an RNAi mechanism.

Art Unit: 1635

Although Saijo et al. are silent as to the ability of the antisense oligonucleotide to reduce the effective amount of clusterin in the melanoma cells, Saijo et al. teach a method of treating cancer with an oligonucleotide targeted to melanoma cells and the method is therefore considered to necessarily reduce the effective amount of clusterin in the melanoma cells, as instantly recited. The instant claims do not recite that the agent or oligonucleotide needs to have any specific relationship with clusterin, but rather be able to reduce the effective amount of clusterin. Since Saijo et al. teach the active step of administering an agent, more specifically an antisense oligonucleotide, to treat cancer via targeting melanoma cells in a subject in need thereof, the oligonucleotide would necessarily be considered to reduce the effective amount of clusterin as a result of treating melanoma, absent evidence to the contrary. Since melanoma cells are being reduced by the oligonucleotide of Saijo et al., clusterin present in the cells would necessarily be reduced as well.

As stated in the MPEP (see MPEP 2112), something that is old does not become patentable upon the discovery of a new property. A recitation of the intended use of the claimed invention must result in a structural difference between the claimed invention and the prior art in order to patentably distinguish the claimed invention from the prior art. If the prior art structure is capable of performing the intended use, then it meets the claim. In a claim drawn to a process of making, the intended use must result in a manipulative difference as compared to the prior art. See *In re Casey*, 370 F.2d 576, 152 USPQ 235 (CCPA 1967) and *In re Otto*, 312 F.2d 937, 939, 136 USPQ 458, 459 (CCPA 1963). Therefore, the instant claims are anticipated by Saijo et al.

Art Unit: 1635

## Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1-5, 11 and 14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Saijo et al. (Oncology Research, Vol. 6, No. 6, 1994, pages 243-249), as explained in the rejection under 35 U.S.C. 102(b) above, in view of Bennett et al. (US 6,111,094)

The above claims are directed to a method for treatment of melanoma in a mammalian subject comprising administering to the subject a therapeutic agent effective to reduce the amount of clusterin in the melanoma cells, wherein the therapeutic agent is an oligonucleotide, more specifically an antisense oligodeoxynucleotide. The antisense oligonucleotide spans either the translation initiation site or the termination site and is enhanced for in vivo stability with a 2'-O-methoxyethyl modification. The therapeutic agent is an RNA molecule effective to reduce the amount of clusterin in the melanoma cells by an RNAi mechanism.

Saijo et al. teach a method of administering antisense phosphorothioate oligodeoxynucleotides *in vivo* to mice targeted to LOX melanoma cells and resultant inhibition of tumor growth *in vivo*.

**Art Unit: 1635** 

The instant specification discloses "The terms RNA, RNA molecule(s), RNA segment(s) and RNA fragment(s) may be used interchangeably to refer to RNA that mediates RNA interference. These terms include double-stranded RNA, single-stranded RNA..." (see last paragraph on page 5). Therefore, the antisense oligonucleotide of Saijo et al. meets the instant limitation of an RNA molecule that would act via an RNAi mechanism.

Although Saijo et al. are silent as to the ability of the antisense oligonucleotide to reduce the effective amount of clusterin in the melanoma cells, Saijo et al. teach a method of treating cancer with an oligonucleotide targeted to melanoma cells and the method is therefore considered to necessarily reduce the effective amount of clusterin in the melanoma cells, as instantly recited. The instant claims do not recite that the agent or oligonucleotide needs to have any specific relationship with clusterin, but rather be able to reduce the effective amount of clusterin. Since Saijo et al. teach the active step of administering an agent, more specifically an antisense oligonucleotide, to treat cancer via targeting melanoma cells in a subject in need thereof, the oligonucleotide would necessarily be considered to reduce the effective amount of clusterin as a result of treating melanoma, absent evidence to the contrary. Since melanoma cells are being reduced by the oligonucleotide of Saijo et al., clusterin present in the cells would necessarily be reduced as well.

Saijo et. al. do not teach antisense oligonucleotides that span either the translation initiation site or the termination site or 2'-O-methoxyethyl modifications.

Bennett et al. teach general antisense oligonucleotide design and teach that

Art Unit: 1635

preferable target regions include the start codons of a desired target. Bennett et al. teach that preferred antisense oligonucleotides comprise modified sugar moieties including 2'-O-methoxyethyl and that such modifications enhance the affinity of the antisense oligonucleotide for a nucleic acid target and increase stability of the oligonucleotide in the presence of nucleases.

It is noted that instant claim 3 does not require for the antisense oligonucleotide to span the translation initiation site or termination site of any specific target sequence. Therefore, any antisense oligonucleotide utilized in a mammalian subject to treat melanoma cells targeted to the translation initiation site or termination site of a target that is effective to reduce melanoma would necessarily reduce clusterin, as explained above.

It would have been obvious to one of ordinary skill in the art to target the antisense oligonucleotides of the method of Saijo et al. to the initiation site, as taught by Bennett et al. It would have been obvious to one of ordinary skill in the art to chemically modify the antisense oligonucleotides of the method of Saijo et al. with 2'-O-methoxyethyl modifications, as taught by Bennett et al.

One would have been motivated to target the antisense oligonucleotides of the method of Saijo et al. to the initiation site because Bennett et al. teach that start codons are a preferable target region for antisense inhibition of target gene expression. One would have been motivated to chemically modify the antisense oligonucleotides of the method of Saijo et al. with 2'-O-methoxyethyl modifications because Bennett et al. teach that 2'-O-methoxyethyl modifications enhance the affinity of antisense oligonucleotides

Art Unit: 1635

for a nucleic acid target and increase stability of the oligonucleotide in the presence of nucleases. Furthermore, Saijo et al. teach phosphorothioate modifications have been widely used because of their increased stability to nucleases. It would have been obvious to incorporate another chemical modification, 2'-O-methoxyethyl, which was known to add the same benefits.

Finally, one would have a reasonable expectation of success given that Bennett et al. teaches that start codons are preferable target regions for antisense oligonucleotides. One would reasonably expect for such design to benefit the activity of the oligonucleotide of the method of Saijo et al. as well. Furthermore, one would have a reasonable expectation of success that a 2'-O-methoxyethyl modification would enhance the activity of the oligonucleotides of the method of Saijo et al. because both Saijo et al. and Bennett et al. teach chemical modifications that enhance oligonucleotide stability.

Thus in the absence of evidence to the contrary, the invention as a whole would have been prima facie obvious to one of ordinary skill in the art at the time the invention was made.

#### Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Amy H. Bowman whose telephone number is (571) 272-0755.

Art Unit: 1635

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Doug Schultz can be reached on (571) 272-0763. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
